

Superstore Sales Analysis

Alben Raj N M

Problem Statement

- The Superstore dataset provides sales and profit data for a variety of products across different categories and regions.
- The goal of this project is to analyse the data and identify insights that can help the company improve its business performance.
- Specifically, we aim to answer questions such as: which product categories are the most profitable? which regions have the highest sales and profit? What are the most profitable products?
- By answering these questions, we hope to provide recommendations for the company on how to optimise its product offerings and improve its revenue and profitability.

Assumptions:

- The superstore dataset contains a representative sample of all transactions conducted by the store during the time period covered by the dataset.
- The data in the superstore dataset is accurate and has been cleaned and preprocessed prior to analysis.
- The superstore dataset covers a sufficient time period to allow for the identification of trends or patterns in sales and profitability.
- The superstore dataset is not impacted by any significant outliers or anomalies that could skew the results of any analysis conducted on the dataset.

Research Questions:

We're interested in understanding which factors contribute to high sales in the superstore

- Which product categories have the highest profit margins in the superstore?
- Are there any significant differences in sales between East region and other regions?

- How do sales vary by product category during different months of the year?
- What is the rate of returned products for orders with same-day shipping compared to other shipping options?
- How do sales and profit vary by product category on weekdays compared to weekends?

Hypotheses:

- I. Technology products have the highest profit margin compared to other product categories.

Conclusion : The hypothesis is supported as technology products have the highest profit margin of the three categories

II. The East region has the highest sales compared to other regions.

Conclusion : As we can see the Central region has more sales . So the Given Hypothesis is not supported

III. Sales are higher during certain months of the year.

Conclusion : Our Hypothesis is supported as sales are higher during certain months of the year

IV. Orders with same-day shipping have the lowest rate of return.

Conclusion : The Hypothesis is supported as the same-day shipping has the lowest rate of return products compared to others.

V. Company's profit is more on weekdays than on weekends.

Conclusion : Our hypothesis is supported as the sales are weekdays are more compared to the sales during the weekends

Results:

- Based on the analysis, it can be concluded that technology products have the highest profit margin compared to other product categories
- The company's profit is higher on weekdays than on weekends. Sales are higher during certain months of the year.
- Orders with same-day shipping have the lowest rate of returned products. However, the hypothesis that the East region has the highest sales compared to the other regions is not supported by the data
- These conclusions provides valuable insights into the company's performance and can guide future decision-making processes.
- It is important to note that further investigation may be required to fully understand the underlying factors influencing these observations.

Suggestions:

- The company should focus on developing and promoting technology products to increase its profits. Also could consider reducing the production and promotion of products with lower profit margins.
- Central region has the highest sales compared to other regions; the company could consider increasing its focus on this region. Then the company should re-evaluate its marketing and sales strategies in other regions.
- The company should focus on maximizing sales during the months of November and December. This could involve increasing the inventory of popular products during this time, running targeted marketing campaigns, and offering promotions or discounts to customers. However , the company should also consider strategies to maintain sales during other months, such as introducing new products or services or offering promotions and discounts during slower months.
- The company could consider offering more same-day shipping to customers. This might involve optimizing inventory and supply chain processes to ensure that products can be shipped quickly and efficiently.
- The company could consider focusing on different types of promotions or sales during the weekends to increase sales. For example, the company could offer weekend only promotions or discounts or run targeted marketing campaigns aimed at weekend shoppers. The company could also consider conducting special events

or activities in-store on weekends to attract customers and increase sales. Additionally, the company could focus on offering products and services that are particularly popular among weekend shoppers, such as home entertainment or outdoor products.
